

Q1. Branch Found, Pipeline Not running

Steps	Response
ERROR	Jenkins discovered the dev branch but skipped the build because it cannot find the jenkins file on the expected path.
ROOT CAUSE	The dev branch on github repo doesn't contain the Jenkinsfile at the expected path stated in the multipathbranch pipeline.
FIX	As we learn from console output the jenkinsfile doesn't exist on dev branch. Following are steps for fix. 1. Check the Github repo dev branch for jenkinsfile on root or any folder in repo. 2. After confirming the file not present anywhere we create the jenkinsfile in dev branch. 3. Commit and push the changes to dev branch.
VERIFY	To verify the dev branch Job working we rescan the Multibranch Pipeline by Build now again. Then confirm the jenkins file is detected by the jenkins from console output that show the 'Jenkinsfile' found and build is not skipped so this verifies that Jenkins found the Jenkinsfile on the dev branch.

Q2. Jenkins File Error on only One Branch.

Steps	Response
ERROR	Invalid condition “branchName”
ROOT CAUSE	“branchName” is not valid Jenkins we need to use only ‘branch’
FIX	<pre>when { branch 'main' }</pre> In the dev branch jenkins file and commit and push it.
VERIFY	Rescan the multibranch pipeline check the branch job main and dev Main - runs the test Dev -skipp the test

Answer:- branch aware conditions allow the multibranch pipeline to execute the stage base on the branch jenkins file.

In main branch jenkins file mention

```
when {  
    branch 'main'  
}
```

So the branch job main is running the main brach so the test is executed

But when the branch job - dev running the jenkinsfiles its not on the main branch thats why its will skipped the test.

Q3. NewBranch Does Not Appear

Steps	Response
ERROR	
ROOT CAUSE	
FIX	
VERIFY	

Q4. Wrong Revision in workplace

Steps	Response
ERROR	Jenkins is building the feature/payment branch, but it checked out the wrong revision.
ROOT CAUSE	1. Wrong branch selection: Jenkins have selected wrong branch or commit during build run and checkout scm.
FIX	Fix the checkout configuration and and setup the multipipeline branch again
VERIFY	Check the console log and verify .

Q5. Feature Branch Reach deploy

Steps	Response
ERROR	Feature branch reaches deploy
ROOT CAUSE	Deploy condition is incorrectly declared so it also include the dev branch with main branch so it dev branch also deploy.
FIX	<pre>stage('Deploy') { when { branch 'main' } steps { sh './deploy.sh' } }</pre> Remove dev branch
Bonus Fix	Add the manual approve so the user will manually approved the deploy from the main branch.
